Internal Roll-a-Finish™ tools

SRMR/SRMB series

Our premier line of internal Roll-a-Finish™ tools, designed to suit all applications. Ideal for applications where tool length is restricted by tool changers, turrets, etc.

Offered in *three styles:*

- Through-hole style with no-helix cage (machine-feeding) as standard.
- Through-hole style with helix cage (self-feeding), made to order.
- Bottoming-style for blind hole, with no-helix cage (machine-feeding) as standard.

... with up to three work lengths:

- SRMR (B)
- SRMR (B)+50mm
- SRMR (B)+100mm
- **■** Longer lengths available on request.

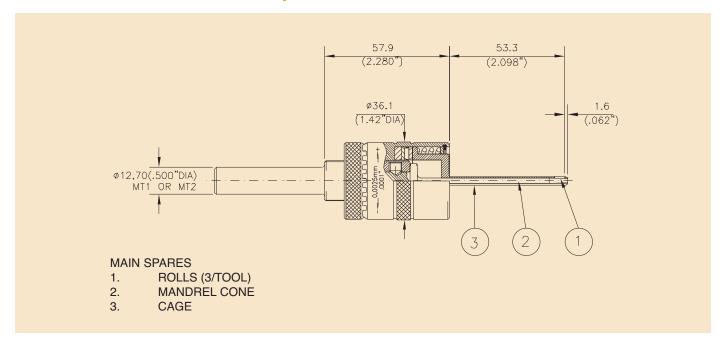

... and available from stock:

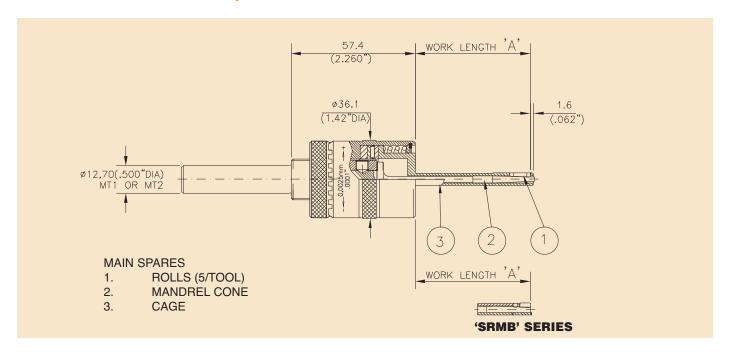

- for hole sizes from 4,00 to 50,00 mm (.157 to 1.968 inches).
- Tools are adjustable in increments of .002mm (.0001 inch).

Bearingizing tools

The Bearingizing Tool combines roller burnishing with peening action. As the tool is rotated at a high speed the rolls spin, rise, and fall over a cammed arbor, delivering up to 200,000 rapid fire blows per minute to the work surface. The peaks and valleys of the machined surface are compacted into a smooth, hardened, and ultrafine surface finish.

The Bearingizer *may* be the tool of choice where the following conditions exist:

- Parts with *thin walls* Bearingizing eliminates barrel-shaping of the part.
- Parts with irregular wall thicknesses — the Bearingizing tool will produce a very round hole, whereas the Roll-a-Finish™ tool might generate a slightly egg-shaped hole, due to variations in wall thickness.
- Applications where *porosity* is an issue (e.g., oil-impregnated bearings) — the smaller "footprint" of the Bearingizing roll leaves pores in the surface intact.
- Applications where *Very* tht tolerances must be held — the Bearingizer reduces springback in the work surface material. The Bearingizing tool can, in some materials and with proper part preparation, hold size as close $as \pm .002mm (.0001 inch),$ while the Roll-a-Finish tool can achieve tolerances of ± .006mm (.00025 inch).

Where the above conditions do **not** exist, the Roll-a-Finish™ tool would generally be the tool of choice, for two reasons:

- (1) the relatively wide adjustment range of the Roll-a-Finish tool, which is typically 1.01mm (.040 inch), and
- (2) the ease of adjustment, with the castellated adjusting collar on the Roll-a-Finish tool.

The Bearingizing tool features a greater number of rolls, and rolls of a smaller diameter, as compared to the Roll-a-Finish tool, and can only be adjusted by change of rolls. The Bearingizer also requires a closer presize than the Roll-a-Finish tool.

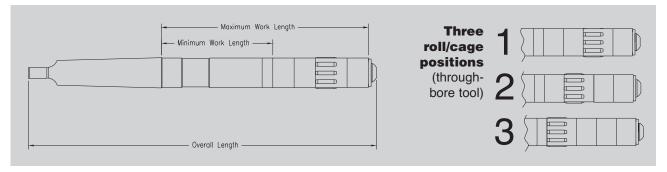

But where the above conditions **do** exist, the Bearingizing tool should be considered.

While the Roll-a-Finish Tool increases surface hardness by about 5 to 10%, Bearingizing increases hardness by 10 to 30%, but with less surface penetration.

Bearingizing tools provide three roll positions over the cammed arbor (see below). When the forward (#1 position) of cam becomes worn, the roll cage can be repositioned to the #2 and #3 positions by exchanging positions with the moveable collars. This presents NEW cam surfaces and original BUILD-UP. After all positions

on the cam are worn beyond producing acceptable parts, oversize rolls can be used to further extend tool life. Roll sizes are available in increments of .0025 mm (.0001inch) and the tool will accommodate a range of roll sizes up to .0508 mm (.002 inch).

For through-hole, semibottoming, or bottoming applications.

Bearingizing Tools 4.76 to 31.75 mm (.188 to 1.250 in.)

Selection & ordering information

To select a tool for the part and material to be Bearingized, determine the proper tool *build-up*. The build-up is the effective tool diameter required to produce a certain size in a given material. It is measured with the rolls diametrically opposed on the high surfaces of the cam.

The build-up is equal to the maximum finished hole diameter plus a spring-back allowance — see chart. The maximum diameter (high side of tolerance) is used to allow for tool wear and still maintain part size within tolerance limits.

Standard tool sizes

Tools are stocked in diameters of 4.7625mm (.187 inch) through 50.80mm (2.000 inch). Each tool provides a build-up range of .1016mm (.004 inch). The required build-up must be within the range of the tool size shown — otherwise select non-stocked tool. See ordering information at right.

EXAMPLE

Stainless Steel part
12.725/12.720mm
(.5010/.5008 inch) tolerance 12.7250

Add Stainless Steel springback allowance ± .0254
Build-up 12.7504

Since a 12.75mm (.5020 inch) build-up falls within a range of 12.67-12.78mm (.4990-.5030 inch), order a standard 12.7mm (.500 inch) through-hole Bearingizing tool and rolls . . . or order through-hole Bearingizing tool with 12.75mm (.5020 inch) build-up — Cogsdill will furnish proper tool and rolls.

Roll Sizes

To determine the roll size for a standard tool, subtract the cam diameter from the build-up and divide by two (2). This establishes the single roll diameter.

E X A M P L E

Build-up required
for part 12.75mm (.5020 inch)
Subtract cam
diameter of 12.75mm
(.500 inch) tool - 8.76mm (.3450 inch)
3.99mm (.1570 inch)

Divided by 2 $3.99 \text{mm} \div 2 = 1.99 \text{mm} (.0785 \text{ inch})$ Single roll size 1.99 mm (.0785 inch)

Order 12.77mm (.500 inch) Bearingizing tool with 1.99mm (.0785 inch) rolls.

Spring-Back Allowances	4.76 to 12 (.188 to .5		12.7 mr (.500 &	
	mm	IN.	mm	IN.
Stainless	.0203	.0008	.0254	.001
Steel	.0203	.0008	.0254	.001
Cast Iron	.0127	.0005	.0203	.0008
Sintered Iron	.0127	.0005	.0203	.0008
Aluminum	.0050	.0002	.0102	.0004
Brass	.0127	.0005	.0203	.0008
Sintered Bronze	.0025	.0001	.0051	.0002
Oilite	.0025	.0001	.0051	.0002

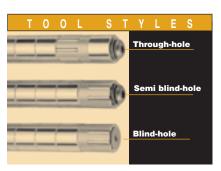

Note: Above are recommended starting points only. Final build-up can best be determined by actual trial and several extra sets of rolls in increments of .0025mm (.0001 inch) are recommended.

Ordering stocked tools

1 Specify tool size and roll diameter, or specify hole size and material.

2 Specify tool style: through-hole, semi-blind or blind-hole tool. Through-hole tools use chamfered rolls; semi-blind or blind-hole tools use radius rolls. Blind-hole tools have a special roll retainer which permits finishing within .635mm (.025 inch) of the bottom.

3 Extra sets of rolls in increments of .002mm (.0001 inch) are recommended with initial orders to allow for final size adjustment and compensate for eventual tool wear.

Ordering non-stocked tools

Intermediate sizes

Sizes that do not fall within the range of stocked tools are ordered by build-up only. Cogsdill will design tool and specify roll size.

Tools over 31.75mm (1.250 inch) in diameter

Order by build-up diameter. Cogsdill will design tool and specify roll size. We suggest that part print be furnished with inquiry. This will enable Cogsdill engineers to quote on any special features that may be desirable, such as extended front pilot, etc.

Re-ordering tools and parts

Re-order stocked tools and parts by fractional tool size shown on shank-except roll sizes, which should be determined by the required build-up. Re-order non-stocked tools and parts, including rolls by BT number shown on shank. If cams are worn, larger rolls may be required (available in increments of .0025mm (.0001 inch). Cogsdill will also re-grind cams and supply rolls to maintain original build-up.

Operation & maintenance

Machines

Any machine capable of rotating the tool — e.g. drill press, speed lathe, or turret lathe — may be used.

Material

Any ductile or malleable material — powdered, laminated, cast, forged, extruded, sintered or hardened (maximum Rc 38) can be bearingized. Steel, stainless, alloy, cast iron, aluminum, copper and brass are examples.

Procedure

Proper part preparation is essential in order to obtain precise results. Cogsdill will recommend the surface preparation and amount of stock to leave for Bearingizing, but some trials may be required to determine these factors for optimum results.

Since the change in dimension is partly governed by the character of the prepared surface, usually coarser preparation will permit a greater change in dimension than is possible with finer preparation. The consistent pattern obtained from boring will produce the best finish.

The other major factor in dimensional change is the ability of the material to grain-flow without flaking. The total change may vary from .0025mm (.0001 inch) on harder materials to as much as .0762mm (.003 inch) on sintered self-lubricating bushings. Less than .0254mm (.001 inch) stock for Bearingizing generally provides a good starting point for trials.

Tool diameter changes

Bearingizing rolls are manufactured in increments of .0025mm (.0001 inch). Bearingizing Tools are adjustable by roll change only. One set of rolls can be removed and a new set of a different size installed, thus effectively changing the size of the tool — or compensating for tool wear. The working diameter of any tool can be changed over an approximate .1016mm (.004 inch) range by installing different sets of rolls. The rolls are diametrically opposed and available in .0025mm (.0001 inch) increments, therefore the effective tool diameter can be changed in .0051mm (.0002 inch) increments. (Refer to preceding page "Ordering Stocked Tools.")

Lubrication

For most metals use any standard grade of lightweight, low viscosity lubricating oil, or any mineral, sulphur or soluble oil that is compatible with the alloy or metal to be burnished and is recommended for fine surface finishing.

For aluminum or magnesium alloys, use a highly refined oil-based coolant with low viscosity.

For cast iron a mineral seal or water soluble solution is ideal — flooding the part is recommended.

Cleaning

The Bearingizing tool should be cleaned periodically with a light-bodied oil of about 100 Saybolt universal scale, similar to a light spindle oil. A few drops applied with squirt can or brush to the rolls and cage (with cage stopped) will wash metal dust particles out when tool is operated, keeping the cam surfaces and roll pockets clean.
